Overview

Diners often face decision paralysis when looking at long menus, making it harder to decide what to eat. This causes slower ordering, longer queues, and a less enjoyable dining experience.

FoodCart reduces decision fatigue by helping customers narrow choices quickly before placing an order.

Our Solution

Aside from the traditional menu, FoodCart provides an intuitive swipe-based feature that helps users quickly decide whether they are interested in a dish by swiping yes or no. It also includes a wheel spinner to choose from selected dishes and an order progress tracker that lets customers monitor their order status in real time.

Wheel Picker

Order Tracking

Key Features

Swipe Left or Right

Discover recommended dishes. Swipe right to select, left to skip, or exit once decided.

Order Tracking

Track order progress and estimated waiting time in real time.

Surprise Feature

Select multiple dishes, choose how many to serve, and receive a surprise meal from your selected options.

Wheel Picker

Spin the wheel to randomly choose from selected dishes when users cannot decide.

Menu Categories

Browse dishes by category and filter meals based on dietary preferences.

Sales Analytics Dashboard

Admin dashboard showing top-selling items, today's revenue, and hourly order trends

SWE Practices

Version Control

Using Git and GitHub for branching, pull requests, informal peer reviews and conflict resolution before merging to support smooth team collaboration.

Object-Oriented Programming

Adhering to OOP principles and coding practices such as BASIC and DRY to keep the project modular, reusable, and maintainable.

Security & Data Protection

Sensitive user data is only collected with user consent when required, following PDPA guidelines. User passwords are hashed before being stored in the database.
